

# VMware vSAN: Troubleshooting

## Course Overview

In this two-day course, you focus on learning the tools and skills necessary to troubleshoot VMwarevSAN™ 7 implementations. You gain practical experience with vSAN troubleshooting concepts through the completion of instructor-led activities and hands-on lab exercises.

## Course Objectives

By the end of the course, you should be able to meet the following objectives:

- Describe the architectural components of vSAN and their roles
- Explain how the components interact with each other
- Explain the differences between object and component states
- Describe how to use Skyline Health to investigate and help determine failure conditions
- Explain how to use the command-line tools to help determine failure conditions

## Target Audience

Storage and virtual infrastructure administrators who want to be able to perform initial troubleshooting on their software defined storage with vSAN

## Prerequisites

Before taking this course, students should take the following courses or have equivalent knowledge and experience:

- [VMware vSphere: Install, Configure, Manage](#)

The course presumes that a student can perform the following tasks with no assistance or guidance before enrolling:

- Use VMware vSphere® Client™ for common operations
- Create and manage VMware vCenter Server® objects, such as data centers, clusters, hosts, and virtual machines
- Create and modify a standard switch
- Modify a distributed switch
- Create a VMware vSphere® VMFS datastore
- Use a wizard or a template to create a virtual machine
- Migrate a virtual machine with VMware vSphere® vMotion® and VMware vSphere® Storage vMotion®
